**Describe the analysis of student learning using the template provided:**

**Explain what your results mean:** What did students master? What have they yet to master? Are they showing progress? Did they meet your expectations? Are any students or group of students performing exceptionally well or unusually poorly? (100 words or less)

The assessment results indicate 87% of observing class mastered knowledge of the rainforest habitat, including plant and animal dependence on their environment, their physical characteristics, and on each other for survival. All the students showed progress, and only two students showed very little improvement. One of these students is in the process of special education testing. I struggled with the second student to obtain full attention, motivate, or participate in learning; and he receives no support at home. Overall, 87% of the class met my expectations.
